App Inventor + IoT: PWM Motor

This tutorial will help you get started with App Inventor + IoT and a PWM Motor.

Before you start you should have completed the <u>App Inventor + IoT Setup tutorial</u>. This tutorial builds on the <u>App Inventor + IoT Basic Connection</u> tutorial. We suggest you build the basic connection tutorial at least once, but you can also download the completed .aia file to get you started <u>here</u>. We are also using a <u>Seeed Grove</u> board for this tutorial. You do not need to use the board, but it does make things easier.

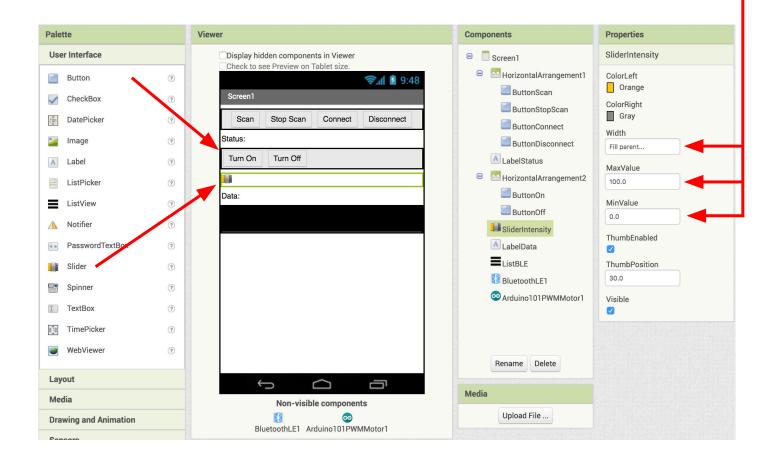

First, we need to make sure we have the correct Arduino code running. Plug in your Arduino and open the AIM-for-Things-Arduino101.ino file (from the Setup tutorial above).

- For this tutorial make sure PWM is set to ENABLED and all others are set to DISABLED
- You should also click the arrow button in the top left to upload the code

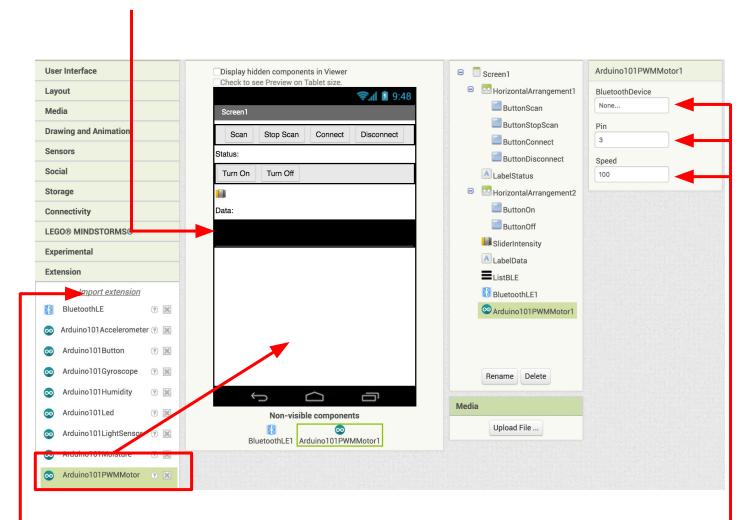

The next steps all build off of the the starter code for the Basic Connection.aia:

- Drag a Horizontal Alignment from the Layout Palette below LabelStatus
 - Drag two Buttons into the Horizontal Arrangement
 - Rename the first "ButtonOn" and change its text to "Turn On"
 - Rename the second "ButtonOff" and change its text to "Turn Off"
- Below the Horizontal Arrangement, drag in a Slider from the Layout Palette
 - Set the Width to "Fill parent"
 - Set MaxValue to 100 and MinValue to 0

Drag a **Label** from the User Interface Palette and drop it between **SliderIntensity** and **ListBLE**

Rename the Label "LabelData"

Now we need to add the necessary extension.

- In the Palette window, click on Extension at the bottom and then on "Import extension" and click on "URL".
 - Paste in this URL: http://iot.appinventor.mit.edu/assets/resources/edu.mit.appinventor.iot.arduino101.aix
- Add the Arduino101PWMMotor extension to your app by dragging it onto the Viewer
- In the Properties tab for the Arduino101PWMMotor1
 - Set BluetoothDevice to "BluetoothLE1"
 - Set Intensity to "100" (should already be set)
 - Set the Pin to match the digital ("D") one you've plugged the PWM Motor into on the Grove board (in this case D6)
 - Note: The Motor <u>must</u> be plugged into the Arduino at pin D3, D5, D6, or D9, and you only type the number (6), not the letter "D".

Now switch to the Blocks Editor view

Now we need turn the LED on and off when we press our buttons.

- From the Blocks pane, from ButtonON drag a when ButtonOn.Click block in and from Arduino101Led1 add call ArduinoPWMMotor1.TurnOn
- From the Blocks pane, from ButtonOFF drag a when ButtonOff.Click block in and from Arduino101Led1 add call ArduinoPWMMotor1.TurnOff

```
when ButtonOn .Click
do call Arduino101PWMMotor1 .TurnOn

when ButtonOff .Click
do call Arduino101PWMMotor1 .TurnOff
```

Next we need to store the data we receive from the sensor. From the Variables drawer in the docs pane, drag an **initialize global name to** block and name it "Speed". From the Math drawer add a number block and set it to "0". We'll use this to keep track of the slider setting for the Motor Speed.

```
initialize global Speed to 0
```

Let's make a new procedure to display the current LED intensity in the **LabelData**. You can create a procedure by dragging out a purple procedure block from the Procedures drawer in the Blocks pane. Let's rename it **updateDataLabel**

- from LabelData add set LabelData.Text to
- From the Text pane, connect a join block
 - Add a textbox with "Speed: "
 - And from Variables add get global global Speed.

Finally, we want to change the brightness of the LED when we move the slider

- From SliderIntensity drag when SliderIntensity .PositionChanged
 - o from variables add set Arduino101PWMMotor1.Speed to
 - Hover over the orange "thumbPosition" in the when SliderIntensity
 .PositionChanged to see the get thumbPoistion block. Connect this
 block to the set Arduino101PWMMotor1.Intensity to block
 - From Variables, drag a set global speed to and add another get thumbPosition block
 - from procedures add call updateDataLabel

```
when SliderIntensity PositionChanged
thumbPosition

do set Arduino101PWMMotor1 Speed to get thumbPosition
set global Speed to get thumbPosition
call updateDataLabel
```

Your app should now be working! Test it out by connecting your Arduino device using the companion (if you haven't already). Test it out by turning on the motor and moving the slider to make it turn faster or slower.
