## App Inventor + IoT: Humidity Sensor

This tutorial will help you get started with App Inventor + IoT and a humidity sensor on an Arduino 101 controller. We are also using a Seeed Grove shield for this tutorial. You do not need to use this board, but it does make things easier. The humidity sensor we recommend is the **Grove temperature & humidity sensor**.

Before you start you should first complete the App Inventor + IoT Setup tutorial to set up your Arduino device.

- Connect the humidity sensor to the Grove board in the D4 pin connector. —
- For this tutorial make sure **TEMPERATURE** is set to **ENABLED** and all others are set to **DISABLED**.
- You should also click the arrow button in the top left to upload the code

AIM-for-Things-Arduino101 §

**ENABLED** 

DISABLED

DTSARLED

ENABLED

1 #define NAME

2 #define DEBUGGING

5 #define BUTTON

6 #define CAMERA

7 #define CONSOLE

10 #define LED

13 #define PINS

15 #define PWM

28 double dt;

16 #define RGBLCD

17 #define SERVO

4 #define ACCELEROMETER

8 #define FINGERPRINT

11 #define LIGHT\_SENSOR

18 #define SOUND RECORDER

19 #define TEMPERATURE

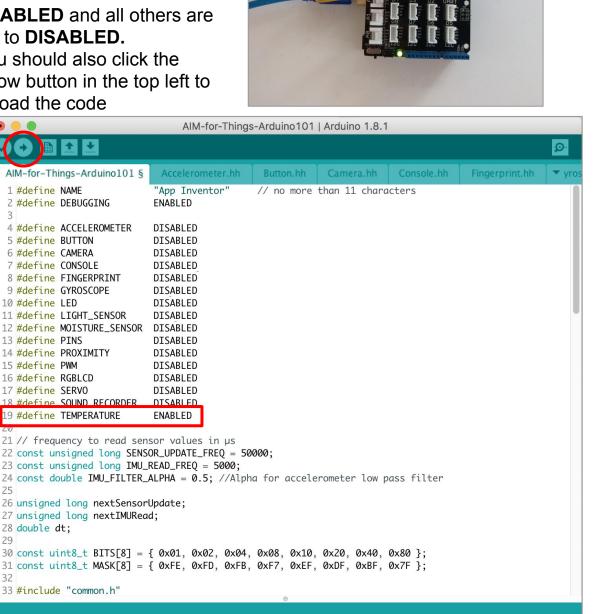

33 #include "common.h"

12 #define MOISTURE\_SENSOR DISABLED

26 unsigned long nextSensorUpdate; 27 unsigned long nextIMURead;

9 #define GYROSCOPE

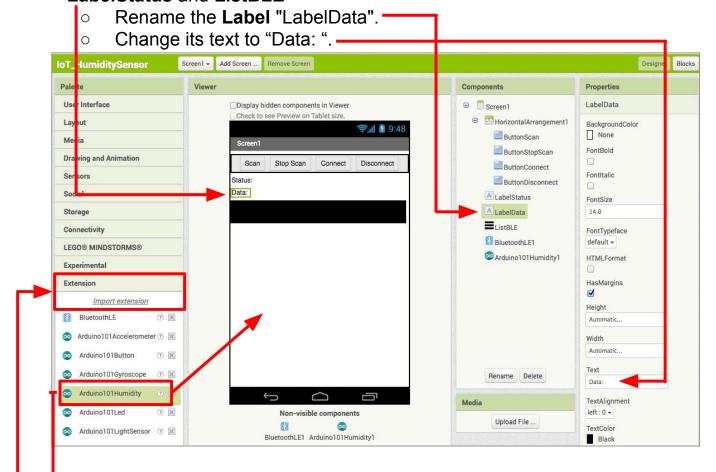

14 #define PROXIMITY

Next, you should complete the <u>App Inventor + IoT Basic Connection</u> tutorial to make a basic connection to the Arduino device. If you prefer, you can download the completed .aia file <u>here</u>.

The remaining steps all build off of the the starter code for Basic Connection tutorial and .aia:

 Drag a Label from the User Interface Palette and drop it between LabelStatus and ListBLE

- Download the <u>Arduino101</u> extension pack to your computer.
- In the Palette, click on Extension at the bottom and then on "Import extension" and then "Choose File". Find the file on your computer and upload it.
- Add the **Arduino101Humidity** extension to your app by dragging it onto the Viewer (the Humidity sensor does both humidity and temperature).

Next, we need to let App Inventor know which pin on the Grove board the humidity sensor is connected to.

- Click on **Ardunio101Humidity1** in the Components pane. •
- In the Properties pane, click on BluetoothDevice and select **BlutetoothLE1**.
- Under **Pin**, enter the <u>digital</u> pin that matches the one the humidity sensor is plugged into on the Grove board (in this case D4).
  - Note: You only need to put the number, not the letter 'D'

## Now switch to the Blocks Editor view

First, we want to set it up so that we request data updates when the sensor value on the Arduino changes.

 from Arduino101Humidity1 in the Blocks pane, add call Arduino101Humidity1.RequestHumidityUpdates to the existing when BluetoothLE1.Connected block that you made in the Basic Connection tutorial.

```
when BluetoothLE1 . Connected

do set LabelStatus . Text to "Status: Connected "

set ListBLE . Visible to false

call Arduino101Humidity1 .RequestHumidityUpdates
```

Next, we need to store the data we receive from the sensor. From the Variables drawer in the Blocks pane, drag an **initialize global name to** block and name it "Humidity". From the Math drawer add a number block and set it to "0". We'll use this to keep track of the sensor value.

```
initialize global Humidity to 0
```

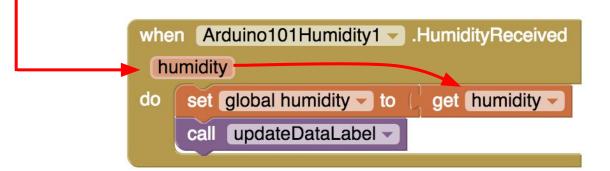

Let's make a new procedure to display the current readings in the **LabelData** when we get new data. You can create a procedure by dragging out a purple procedure block from the Procedures drawer in the Blocks pane. Let's rename it **updateDataLabel.** 

- o from LabelData in the Blocks pane, add set LabelData.Text to.
- from the Text drawer connect a join block.
  - From the Text drawer, connect a text block and type "Humidity: "
  - From the Variables drawer connect a **get global Humidity**.

```
to updateDataLabel
do set LabelData . Text to pion "Humidity: "
get global Humidity
```

Finally, we need to call the procedure when this data is received.

- From the Arduino101Humidity1 drawer in the Blocks pane, drag when Ardunio101Humdity1.HumidityReceived
  - o from the Variables drawer, add **set global Humidity.**
  - o Hover over the orange "reading" in .HumidityReceived to see the get humidity block. Drag the get humidity block from this window and snap to set global humidity.
    - o from the Procedures drawer, add call updateDataLabel.

Your app should now be working! Connect your Android device using the MIT Al2 Companion (if you haven't already). Test it out by closing your hand around the sensor. If it is working, you should see the data label change.
